Hunter College of CUNY

(a) Write a function that computes the sum of two integers. Call your function from `main()` to add the numbers 3 and 4. Output the result.

(b) Write a function that computes the average of two integers. What should the return type of your function be? Call your function from `main()` to compute the average of 3 and 4. Output the result.

Note: Make sure your functions **return** the result rather than simply outputting it.
