

CSCI 415 Computer Networks

Homework 1

Solution

Saad Mneimneh
Computer Science
Hunter College of CUNY

Problem 1

Listen to the first movement of Beethoven's fifth symphony.

ANSWER:

Problem 2

Write the following sentence in Morse code:

"I am in the CSCI 415 class."

ANSWER:

.. .- -- .. -. - -.-. ... -.-.- -.-. -. .-

Problem 3

Compile the following server and client C++ code and run it. You will be asked to modify the code in a later homework.

server.c

```
#include <iostream>
#include <sys/types.h>
#include <sys/socket.h>
#include <netinet/in.h>
#include <unistd.h>

using std::cout;
using std::cin;
const unsigned short int port = 5432;
const int max_pending = 10;
const int max_len = 256;
```

```

int main() {

    sockaddr_in address; //address
    sockaddr_in client_address; //client address
    char message[max_len];

    int s;
    int new_s;
    int len;

    //build address
    memset(&address, 0, sizeof(address));
    address.sin_family = AF_INET;
    address.sin_addr.s_addr = htonl(INADDR_ANY);
    address.sin_port = htons(port);

    //setup passive open
    if ((s=socket(PF_INET, SOCK_STREAM, 0)) < 0) {
        cout<<"error in socket";
        return 0;
    }

    //bind socket to address
    if (bind(s, (sockaddr *)&address, sizeof(address)) < 0) {
        cout<<"error in bind";
        return 0;
    }

    if (listen(s, max_pending) < 0) {
        cout<<"error in listen";
        return 0;
    }

    //wait for connection, then receive message
    socklen_t size = sizeof(sockaddr_in);
    while (1) {
        if ((new_s = accept(s, (sockaddr *)&client_address, &size)) < 0) {
            cout<<"error in accept";
            return 0;
        }

        while (len = recv(new_s, message, sizeof(message), 0)) {
            cout<<message<<"\n";
        }
        close(new_s);
    }
}

```

client.c

```

#include <iostream>
#include <sys/types.h>
#include <sys/socket.h>
#include <netinet/in.h>
#include <unistd.h>

using std::cout;

```

```

using std::cin;
const unsigned short int port = 5432;

int main() {
    int s;
    sockaddr_in address; //address to connect to

    memset(&address, 0, sizeof(address));
    address.sin_family = AF_INET;
    address.sin_port = htons(port);
    address.sin_addr.s_addr = htonl(INADDR_ANY); //my IP address

    //active open
    if ((s=socket(PF_INET, SOCK_STREAM, 0)) < 0) {
        cout<<"error in socket";
        return 0;
    }

    //connect
    if (connect(s, (sockaddr *)&address, sizeof(address)) < 0) {
        cout<<"error in connect";
        close(s);
        return 0;
    }

    char message[256];
    while(cin.getline(message, 256, '\n')) {
        if (strlen(message) == 0)
            break;
        send(s,message,strlen(message)+1,0);
    }
    close(s);
    return 0;
}

```

Start one server and one client in separate windows. Start the server first; otherwise, the client will not be able to connect to the server and will report an error and exit. The client should accept messages from the keyboard (you) and sends them to the server. The server just echoes what you send. To exit the client just type an empty message (hit Enter).

Notes:

If you are using Windows, you only need to include the following header files:

```

#include <iostream>
#include <winsock.h>

```

Also, you need the following Windows specific initialization of sockets in both the server and the client:

```

WORD wVersionRequested;
WSADATA wsaData;
wVersionRequested = MAKEWORD( 1, 1 );
WSAStartup( wVersionRequested, &wsaData );

```

Replace this line in the client:

```
address.sin_addr.s_addr = htonl(INADDR_ANY); //my IP address
```

by the following line:

```
address.sin_addr.s_addr = inet_addr("127.0.0.1");  
//127.0.0.1 designates the local host
```

Also replace `socklen_t` by `int` and `close` by `closesocket` and compile with the linker option `-lwsck32` if needed.

Problem 4

Calculate the total time required to transfer a 1000 KB file in the following cases assuming an RTT of 100 ms, a packet size of 1 KB, and an initial $2 \times \text{RTT}$ of “handshaking” before data is sent:

(a) The bandwidth is 1.5 Mbps, and data packets can be sent continuously.

ANSWER: We have a $2 \times \text{RTT}$ initial handshake, followed by the time to transmit 1000 KB, and finally the propagation delay (half RTT) for the last bit to reach the other side. Therefore, we have:

$$2 \cdot 0.1 + 1000 \cdot 2^{10} \cdot 8 / (1.5 \cdot 10^6) + 0.1/2 = 5.711 \text{ sec}$$

(b) The bandwidth is 1.5 Mbps, but after we finish sending each data packet we must wait for one RTT before sending the next.

ANSWER: After transmitting a packet, we wait for one RTT. Therefore, since $\text{RTT} > \text{transmission time} + \text{propagation delay}$, by the time we transmit the next packet, the first packet has already reached the other side. So, we need the transmission time of a packet + one RTT for each of the first 999 packet. For the last packet, we must wait for the propagation delay for the last bit to reach the other side. Therefore, the total time is as before plus 999 RTTs.

$$5.711 + 999 \cdot 0.1 = 105.611 \text{ sec}$$

(c) The bandwidth is “infinite”, meaning that we take transmit time to be zero, and up to 20 packets can be sent per RTT.

ANSWER: We have 49 RTTs between batches of 20. The last batch needs half RTT for propagation delay. We also have the 2 initial RTTs, for a total of 51.5 RTTs, i.e. 5.15 sec.

(d) The bandwidth is infinite, and during the first RTT we can send one packet (2^0), during the second RTT we can send two packets (2^1), during the third RTT we can send four packets (2^2), and so on. (We will look at this technique later on.)

ANSWER: Note that $1 + 2 + 4 + \dots + 2^l = 2^{l+1} - 1$. Therefore, we want $2^{l+1} - 1 \geq 1000$, which means $l = 9$. We must wait for half an RTT at the end for the propagation delay. With the 2 initial RTTs, this is 11.5 RTTs, i.e. 1.15 sec.
