## Guidance on the Midterm Exam

What might be on the midterm exam? What should you study?

1. The format of the exam will be like that of the quizzes - true/false, multiple-choice, short-answer questions.
2. There will be what I call “work-through” questions, where you are given the inputs or outputs to an algorithm or a formula, and will be expected to apply that algorithm/formula, etc to the instance you are given.
3. All material that we covered in class up to and including **Multi-level Feedback Queues** in **Chapter 5 Threading**, is potentially the source of a question.
4. The chapter summaries through Chapter 5 on the course website are up to date and should serve as guidance for what you should know.
5. Not everything in the summaries will be covered. It is a gamble on your part if you only know some of it and not all of it. I cannot possibly ask questions about all of that material, but I will choose material from each chapter.
